Recent Price \$0.48

Opinion – buy, strong buy on break over \$0.55

Today Rokmaster announced assay results of diamond drill holes RR21-34 to RR21-40 and wedge drillholes RR21-28a and RR21-28b. The assay results presented in these drillholes once again conclusively demonstrate the strong lateral and vertical continuity of gold enriched massive sulphides in the Revel Ridge Main Zone and silver-zinc mineralization hosted within the Revel Ridge Yellowjacket Zone. This is a good 3D graphic that shows the fan out holes in the 2.1 million ounce resource.

They will be able to upgrade and increase resources here. It is getting easier to see 3 million ounces with successful RRMZ intercepts over broad step outs beyond current resource. They are shown above as deeper intersects:

- 4.64 m of 3.94 g/t AuEq in hole RR21-34
- 5.50 m of 3.65 g/t AuEq in hole RR21-36
- 3.00 m of 11.48 g/t Au in DDH RR21-40 with **no obvious association with arsenical sulphides (0.04% As)**

There are several kilometers of strike that can expand the resources. Drill hole RR21-40 is the first indication there could be an arsenic free deposit at depth. This could be a similar to what happened at [Kirkland Lake's Fosterville mine in 2015](#) when they found better and higher grade deposits at depth. The CEO's comments outline plans going forward

John Mirko, President and CEO of Rokmaster commented, "The nine drillholes in this news release compile the final results of 42 underground drillholes of the 16, 400 metre Phase 1 underground drill program conducted at Revel Ridge. Over a short nine-month period, underground drilling at Revel Ridge continues to establish this gold-rich, polymetallic sulphide resource as one of the premier undeveloped gold deposits within the Western Cordillera. Within this large-scale structural and hydrothermal system spanning several kilometres, we have discovered the development of a previously undiscovered mineralized zone – the RR28Z – in addition to new southeast extensions to the RRYZ, and have the first indications for the development of gold mineralization within the RRMZ with a greatly reduced association with arsenical sulphides. As we move into the first phase of the surface drill program, we begin to target new gold mineralized zones at very shallow depths with full knowledge that mineralization in this environment extends at the kilometre scale, both along strike and at depth. We have high confidence that our surface drilling program will meet with the same remarkable success as our recently completed Phase 1 underground program. Rokmaster looks forward to joining that exclusive group of explorers who have, on every occasion, significantly expanded the Revel Ridge resource."

Hopefully you bought at \$0.40 on my update last week. With recent results it is a good buy here and the resistance area might provide some liquidity. If the stock breaks above \$0.55 it will at least test recent highs.

Opinion - buy

Yesterday ENDR reported a new polymetallic vein system has been identified on the northern end of the Cuba Trend. The vein system, which is now known as Havana is the largest geochemical anomaly along the trend. The area is located approximately 1,500m directly west of the Chachi Central Zone. Chachi and Havana (part of the Cuba Trend) are 2 of 4 major systems within the Company's Newmont Lake Project.

Highlights:

- A multi-element vein system has been identified as the possible source of the 1,800m long Havana geochemical anomaly.
- A sample of the quartz-barite vein on surface assayed **1,277 g/t silver, 4.51% copper, 1.11% zinc, and 0.21% lead**. Another sample 60m along strike assayed **854 g/t silver, 5.34% copper, 4.34% zinc, and 1.53% lead**.
- An induced polarization ("IP") geophysical survey line over the target identified an anomaly coincident with the surface geochemical anomaly.
- The company is currently investigating a possible link between Havana and Chachi – located 1,500m west of Havana.

On the graphic you can see that the silver in soil anomaly, the IP survey and now high grade surface samples line up. This makes the odds very high that the drills will hit this year and maybe hit very big.

On the chart, the stock is in between support and resistance and a good buy here. These Golden Triangle and Yukon stocks normally run up in the summer/fall.

Huge Covid-19 news story breaks

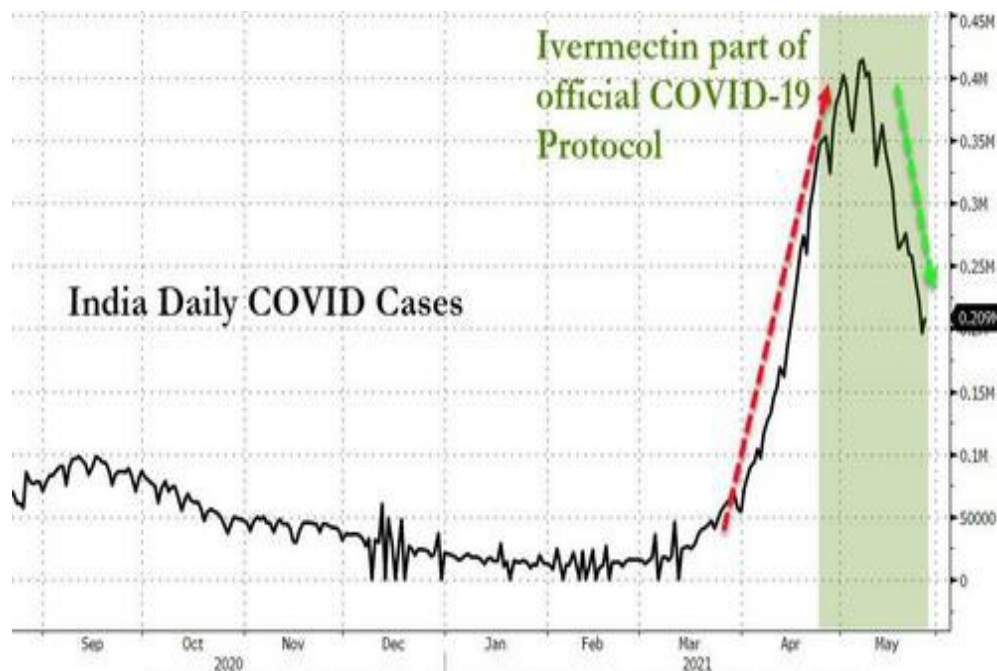

Michael Capuzzo, a New York Times best-selling author, has just published [an article](#) titled “The Drug That Cracked Covid”. The 15-page article chronicles the gargantuan struggle being waged by frontline doctors on all continents to get ivermectin approved as a Covid-19 treatment, as well as the tireless efforts by reporters, media outlets and social media companies to thwart them.

It is too bad there is so much cover up on Covid-19 facts and this was not in NY Times, but the truth will eventually come out and this is a huge step in that direction. Capuzzo, is a six-time Pulitzer-nominated journalist best known for his *New York Times*-bestselling nonfiction books ***Close to Shore and Murder Room***. He ended up publishing his article on ivermectin in [Mountain Home](#), a monthly local magazine for the of the Pennsylvania mountains and New York Finger Lakes region, of which Capuzzo’s wife is the editor.

[There is significant coverage by Zerohedge and everyone should have a read.](#)

Four weeks after the government included ivermectin and budesonide among its early treatment guidelines, the country has recorded its lowest case count in 40 days.
