**Opinion – strong buy**

**Recent Price \$0.05**

DHR announced results from the first hole of five drill holes on their Caldera drill program. Selected core from each of the five holes has been sent for analysis, with the next results expected in late November. The initial drill hole, CP21-01, has anomalous gold results up to 324 parts per billion gold over 1.4 metres. The drill hole intersected primarily volcanic tuffs, moderate to strong propylitic and argillic/sericitic alteration, as well as multiple fault zones.

I am not sure why they would release one poor result. In small drill programs it is best to release all drill holes together. It can be argued that if you have a spectacular result that is material information, it should be released. This certainly was not and it only disappointed the market.

It is only one of five holes and one of five targets. One of the next targets will most likely have way better results than this first hole. I have the stock as a strong buy because of the price and sell off on an incomplete and inaccurate measure of the recent drill program.

A correction to yesterday's issue. This line should have been Remdesivir, not Invermectin

“May 1<sup>st</sup> 2020 memo from Fauci advised hospitals to use this deadly trial drug **Invermectin** Remdesivir to treat Covid-19. It is still recommended, you [can see it here with the NIH advisement to hospitals as of August 25, 2021.](#)”

I had a couple questions on Florida doing better. I should have put that in better context. In more detail they recovered quicker and farther from the last wave than most states despite a non restrictive policy

Check out the current stats, their cases
